* NOTE: This is a 'working draft' sequence. It currently
consists of 89 contigs. The true order of the pieces
* is not known and their order in this sequence record is
* arbitrary. Gaps between the contigs are represented as
* runs of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
* as soon as it is available and the accession number will
                                                                                                                                                                                                                                                                                                                                                                                                                                                      831 bp in length

It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.
                                                                                                                                                                                                                                                                                                                              This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This clone was mapped by Grieff, M., Whyte, M. P., Thakker, R. V., and Mazzarella, R. Sequence analysis of 139 kb in Xp22.1 containing spermine synthase and the 5' region of PEX. Genomics 44:227-231 (1997).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  'note="match to AF019612 (PID:92745733)"

Concess were identified by a combination of three methods: Gene prediction programs including GRAIL (available by anonymous ftp from arthur.epm.orn.gov), Genefinder (Phil Green, University of Washington), Genscan (Chris Burge, http://gnomic.stanford.edu/-chris/GENSCANW.html), and NetPlantGene (http://www.cbs.dtu.dk/netpgene.chcbsnetpgene.html), searches of the complete sequence against a peptide database and the Arabidopsis BST database at TIGR (http://www.tigr.org/tdb/at/at.html). Annotated genes are named to indicate the level of evidence for their annotation. Genes without significant peptide similarity to other proteins are named similarity to other proteins are named similarity to other proteins are named similarity but with EST similarity are named as 'unknown' proteins. Genes without protein or EST similarity, that are predicted by more than two gene prediction programs over most of their length are predicted by tRNAscan-SE (Sean Eddy, Simple repeats are identified by repeatmasker (Arian Smit, http://ftp.genome.washington.edu/RM/RepeatMasker.html). Regions of genome washington.edu/RM/RepeatMasker.html). Regions of exons by GRAIL are anotated as misc features.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     /translation="WKQNIYAVDILLNQMRDRNIKLDSFVVSAIIETNCDRCRTEGAS

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Direct Submission

Submitted (04-AUG-1999) Sanger Centre, Hinxton, Cambridgeshire, Callo 15A, UK. E-mail enquiries: humquery@sanger.ac.uk Clone requests: clone-request@sanger.ac.uk

On May 11, 1999 this sequence version replaced gi:4741514.

During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:

Em: EMBL: Sw:, SWISSPROT; Tr:, TREMBL

This sequence is the entire insert of clone 782123. This sequence has been finished according to sequence map criteria as follows. An attempt is made to resolve all sequencing problems, such as compressions and repeats, but not necessarily within known annotated human repeat sequence elements (e.g. Alu). Where the feature the sequence elements (e.g. Alu). Where the feature is an annotation using the 'unsure'
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           complement(join(<26. .108,605. .639,2393. .2486,4942. .5082,6225. .6286,6755. .6842,16087. .16197,16754. .16955,108085. .12525,21675. .24962,28335. .2835,19865. .18255,21673. .1865,33057. .33107,36418. .36490,

No attempt has been made to order or orient the contigs relative to one another correctly before concatenating. At each location in the sequence where contigs have been joined, several consecutive Ns may have been inserted.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Diedt Submissined

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      A single-stranded DNA (or its complementary strand or the corresp. A single-stranded DNA (or its complementary strand or the corresp. double-stranded DNA) which comprises one of the 7837 "GS" sequences given in T19001-T26837 and which is able to hybridise to part of human genomic DNA, cDNA or MRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-untranslated sequence is unique to a particular mRNA species, almost all the 3'-criented conNa hybridise with specific mRNA. Bach library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             05-MAR-1998 (first entry)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Kev
    Polynocleotide(s) and proteins derived from Staphylococcus aureus stored on computer readable medium and used in the production of anti-S. aureus vaccines.

Claim 1: Page 1260-1261; 3271pp; English.

This sequence represents one of 5191 Staphylococcus aureus DNA sequences of the invention. The DNA sequences are recorded on a computer readable medium, preferably selected from a floppy or hard disk, random access memory (RAM), read-only memory (ROM) or CD-ROM. Homology searches using the S. aureus. DNA sequences allows: putative functions to be assigned so that protein-encoding or regulatory regions of commercial, therapeutic or industrial importance can be obtained. Specifically, sequences which are likely to encode antigens have been identified and these polypeptides can
                                                                                                                                                                                                                                                                                                                                                                                                                   be used in a vaccine composition against S.aureus infection. The polypeptides can also be used in a kit for the immunodetection of S.aureus in a sample. S.aureus is implicated in numerous human diseases, including cellulitis, eyelid infections, food poisoning, osteomyelitis, skin and surgical wound infections, scalded skin syndrome, toxic shock syndrome, etc. Organisms transformed with the DNA sequences can be used for recombinant production of the polypeptides. The new DNA sequences (and their fragments) are useful as primers or probes for isolating homologues of any of the S.aureus DNA sequences contained on the computer readable medium.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           28-JUL-1997 (first entry)

Claim 1; Page 413-414; 2084pp; English.

A computer readable medium has been developed which has recorded on it 982 nucleotide sequences isolated from the Enterococcus faccalis genome. X12938 to X13919 represent these nucleotide sequences which are primary nucleotide sequences, also known as contigs. The computer-based system commercial importance. The Enterococcus faccalis genome with commercial importance. The products can be used to detect the presence of Enterococcus faccalis in samples. They can also be used for progression of disease, and for identifying agents which can be used to modulate the growth or pathogenicity of Enterococcus faccalis, or
                                                                                                                                                                                         Preph. of active lipase in high quantities - by subjecting to denaturation and restructuring in presence of chaperone molecule Example 10; page 43; 78pp; English.

Two genes were cloned and sequenced from Pseudomonas cepacia DSM 1401. The genes were designated lipp (044280) and limb (044281) and they code for a lipase and a lipase modulator protein, respectively. Due to the extreme GC content of the DNA, the sequence was difficult to determine (hence the "others" in the sequence). The limb start codon is positioned 3 bp downstream of the lipb stop codon. Lipp and climb were found to be homologous to Liph and LimA, respectively. In denaturation/renaturation experiments, LimA chaperone protein was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated Enterococcus faecalis polynucleotides and polypeptides - used to develop products for the detection of Enterococcus and for use in vaccines for prevention or attenuation of Enterococcus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 19-MAR-1999 (first entry)

A computer readable medium has been developed which has recorded on it
A computer readable medium has been developed which has recorded on it
982 nucleotide sequences isolated from the Enterococcus faecalis genome.
X12938 to X13919 represent these nucleotide sequences which are primary
nucleotide sequences, also known as contigs. The computer-based system
can identify fragments of the Enterococcus faecalis genome with
commercial importance. The products can be used to detect the presence
of Enterococcus faecalis in samples. They can also be used for
diagnosing Enterococcal infection in an animal and monitoring
progression of disease, and for identifying agents which can be used to
modulate the growth or pathogenicity of Enterococcus faecalis, or
another related organism, in vivo or in vitro. In particular the
polypeptides encoded by the Enterococcus faecalis nucleotide sequences
can be used in vaccines to prevent or attenuate an Enterococcal
  particular the
nucleotide sequences

New isolated Enterococcus faecalis polynucleotides and polypeptides

New isolated Enterococcus for the detection of Enterococcus and for

used to develop products for the detection of Enterococcus and for

use in vaccines for prevention or attenuation of Enterococcus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Enterococcus faecalis genome contig SEQ ID NO:603.
Enterococcus faecalis; contig; detection; Enterococcal infection; vaccine; attenuation; computer readable medium; ds.
another related organism, in vivo or in vitro. In particular the polypeptides encoded by the Enterococcus faecalis nucleotide secan be used in vaccines to prevent or attenuate an Enterococcal
                                                                             749
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        738

 claim 4; Pages 28:31; 31pp; English.

This cDNA encodes an isoform of the EXT2 gene associated with hereditary multiple exostoses and chondroarcoma. The polynucleotide is an isoform of the EXT2 gene described in Nature Genet., 14, 25, 1996. The polynucleotide can be used in the detection and treatment of EXT2-related diseases, and to identify compounds which activate or inhibit receptors for the encoded polypeptide. The polypeptide can be recombinantly the encoding nucleic acid.

R to mid to x13919 represent these nucleotide sequences which are primary

nucleotide sequences, also known as contigs. The computer based system

can identify fragments of the Enterococcus faecalis genome with

commercial importance. The products can be used to detect the presence

of Enterococcus faecalis in samples. They can also be used for

diagnosing Enterococcus infection in an animal and monitoring

progression of disease, and for identifying agents which can be used to

modulate the growth or pathogenicity of Enterococcus faecalis, or

another related organism, in vivo or in vitro. In particular the

polypeptides encoded by the Enterococcus faecalis nucleotide sequences

can be used in vaccines to prevent or attenuate an Enterococcal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               claim 1; Page 1021-1027; 2084pp; English.

A computer readable medium has been developed which has recorded on it 982 nucleotide sequences isolated from the Enterococcus faecalis genome. X12938 to X13919 represent these nucleotide sequences which are primary nucleotide sequences, also known as contigs. The computer-based system can identify fragments of the Enterococcus faecalis genome with commercial importance. The products can be used to detect the presence of Enterococcus faecalis in samples. They can also be used for diagnosing Enterococcus infection in an animal and monitoring progression of disease, and for identifying agents which can be used to modulate the growth or pathogenicity of Enterococcus faecalis, or another related organism, in vivo or in vitro. In particular the polypeptides encoded by the Enterococcus faecalis nucleotide sequences are also be used in vaccines to prevent or attenuate an Enterococcal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Enterococcus faecalis.

Non-A, non-B, non-C, non-D, non-E Hepatitis virus reagents - useful
for diagnosis and therapy of hepatitis GB virus
Example 5: Page 193: 661pp; English.

Double stranded hepatitis GB virus
C prepare a lambda phage HGBV const library. The cDNA clone T00049,
which encodes the proteins R81447-50 and R82064/65 (the 6 possible reading frames), was rescued from the lambda phage, searched
c against a sequence database and found to be an unique HGBV
sequence. Reagents which comprise the HGBV DNA, or its protein
c prods. can be used for the diagnosis, therapy or in a vaccine to

Non-A, non-B, non-C, non-D, non-E Hepatitis virus reagents - useful for diagnosis and therapy of hepatitis GB virus

Example 9; Page 286; 661pp; English.

Example stranded hepatitis GB virus (HGBV) DNA obtd. from HGBV

Couble stranded hepatitis GB virus (HGBV) DNA obtd. from HGBV

infected tamarin plasma, using standard procedures, was used to repare a lambda phage HGBV cDNA library. CDNA clones rescued from the lambda phage were searched against a sequence database and found to be unique HGBV sequences. Then a series of PCR experiments were performed to obtain additional HGBV sequences, i.e. T00156-28 Reagents which comprise the HGBV DNA, or its protein prods. can be used for the diagnosis, therapy or in a vaccine to prevent HGBV infection.

Sequence 337 BP; 99 A; 88 C; 79 G; 71 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Leary TP;

New vaccines for filarial parasite infection(s) - comprising C-terminal beta-tubulin amino acid sequence from a parasite Example 6, Page 51-53 67pp; English.

A CDNA clone (141700) codes for the beta-tubulin (R99425) of the filarial nematode Brugia pahangi. The C-terminal portion (see also R99420) of the beta-tubulin is useful in novel vaccines against filarial parasite infections.

Sequence 1347 BP; 381 A; 262 C; 337 G; 367 T;
                                    19-JAN-1997 (first entry)
Brugia pahangi beta-tubulin cDNA.

Monocotyledonous rice is a diploid plant (2n-24) with a haploid genome equivalent of 431 Mbp (Arumuganathan and Earle, 1991). The relatively small genome of rice, three times larger than that of Arabidopsis, makes it suitable for genomic studies. In order to facilitate positional cloning, physical mapping and genome sequencing of rice, we have constructed a BAC library from Oryza sativa,
transformed into E. coli strain XL2 Blue MRF'. Recombinant clones from the first plating of the library were selected for sequence analysis using T3 and T7 brimers."

Initial assessment of human gene diversity and expression patterns based upon 83 million nuclectides of CDNA sequence
No Sep 12, 1996 this sequence version replaced gi:1397790.

Contact: Kerlavage, AR
Nipponbare variety using EcoRI as the cloning enzyme. The library contains 55,296 clones with an average insert size of 121 Kb providing approximatley! 15 haploid genome equivalents. The deep coverage allows the isolation a particular sequence with a probability of 99.9 %. Three high density filters, each containing 18,432 clones (doubly spotted), represent the whole library for colony screening and can be requested from the Clemson University BAC/EST Resource Center (www.genome.clemson.edu)."
